

Life Cycle Initiative

DTU

Modelling life cycle impacts of toxics on humans and ecosystems with the USEtox™ model

1-day course

Michael Hauschild
Quantitative Sustainability Assessment
DTU Management Engineering

DTU Management Engineering
Department of Management Engineering

USEtox™

M. Hauschild
The author is LCA
PR, DTU, Lyngby
8 April 2015
1

Life Cycle Initiative

DTU

Programme

- 9.00 General introduction** (M.Hauschild)
 - Programme
 - Source to damage cause-effect chain relationship and modelling steps
- 9.20 Chemical fate modelling** (M.Birkved)
 - Overview of typical environmental mass balance concepts
 - Introduction to transport and degradation rate calculations as well matrix solutions.
- 10.40 Break**
- 11.00 Human Exposure Modelling** (R. Rosenbaum)
 - Overview of human exposure concepts
 - Direct and indirect pathways
 - Subsistence vs. production-based approaches to food-based exposures.
- 12.30 Lunch**

2

Life Cycle Initiative

DTU

Programme

- 13.30 Effects Modelling** (S.I Olsen and H.F. Larsen)
 - Risk-based and DALY-based human toxic effect factors
 - EC50-based ecotoxicity effect factors
 - Characterisation factors
- 15.00 Calculation of characterization factors** (M. Hauschild)
 - Fate, exposure and effect modelling into unique metric
- 15.20 Break**
- 15.40 Source to impact framework and uncertainty** (R.Rosenbaum)
 - Matrix approach, USEtox™ model
- 16.00 Overall Modelling with USEtox** (All)
 - Characterisation factors for human health impacts and ecotoxicological impacts
- 17.00 Course adjourned**

DTU

Teachers

Morten Birkved
Assistant professor, system modelling and life cycle inventory analysis, environmental models

Ralph Rosenbaum
Associate professor, chemical-related impacts in life cycle impact assessment, involved in development of USEtox

Stig I Olsen
Associate professor, human toxicology, decision support tools for management and development based on LCA

Henrik Fred Larsen
Senior research associate, ecotoxicology, use of LCA for optimisation of wastewater treatment systems

Michael Hauschild
Professor, life cycle impact assessment and sustainability assessment, involved in development of USEtox

DTU Management Engineering
Department of Management Engineering

Life Cycle Initiative

DTU

In summary...

LCA aims to cover all relevant environmental impacts represented by impact categories and indicators
In order to avoid unwanted bias, best estimate is aimed for in the characterisation modelling
LCIA assesses impacts at midpoint or endpoint in impact pathway
Characterisation factors are substance-specific expressions of relative hazardousness or impact potential
Indicator scores are aggregated over the life cycle
Characterisation of chemical impacts inspired by ERA but fundamental differences exist

Characterisation

- how much does the emission contribute?

Quantitatively determine the impact score per environmental category

$$IS = \sum_i \sum_x CF_{x,i} \cdot m_{x,i}$$

IS = impact score
CF = characterisation factor
m = life cycle emission
x = substance type
i = compartment type

a **Characterisation Factor** is a quantitative representation of the (relative) hazardousness of a specific emission expressed in absolute metric or relative to a reference substance
e.g. the human toxicity characterisation factor of benzene is 300 CTU

6

Life Cycle Initiative

Environmental impacts at endpoint

- Damage to human health (e.g. *Years of Life Lost*)
- Damage to ecosystem quality (e.g. *Disappeared fraction of species*)
- Damage to resources (e.g. *Extra energy demand*)
- Damage to the man-made environment (e.g. *Euros*)

Calculation of characterisation factors

9.20 Chemical fate modelling (M.Birkved)	FF	} iF
11.00 Human Exposure Modelling (R. Rosenbaum)	XF	
13.30 Effects Modelling (S.I Olsen and H.F. Larsen)	EF	
15.00 Calculation of characterization factors (M. Hauschild)	CF	
15.40 Source to impact framework (R.Rosenbaum)	CF = iF · EF	} CF = FF · EF
16.00 Overall Modelling with USEtox (All)	CF = FF · EF
